

TravelR

Problem description:

This application is basically a location based reminder, Users are provided with a map view and a list view of their checkins. Users can add a new checkin or new reminder at any location by searching the map with the help of search box provided.

Once the required place is found, user should tap on the map to add a new note here. While adding a note the user can also share it on Google+.

Users are provided with an option to set tracking on and off. If tracking is on, a service is started and it checks if the current location of user is near any of his past checkin and if so alert the user with a notification.

This application is useful for people travelling alone in a bus or a train, and they want to get up at some location, then they can add a reminder at that location and TravelR will wake them up at that place. A simple and easy to use interface supplements its usecases.
